

PREVIEWING SYSTEM AND METHOD

09307261

Abstract of the Disclosure

- A method and system for previewing accessories prior to purchasing is disclosed. In one embodiment a first image of a portion of a person can be provided to an input device. Then, a second image including an image of an accessory is selected from an electronic database of accessory images. After obtaining the first and second images, data of the first and second images are used to generate data of a composite image, preferably on a server computer. The composite image is displayed on an output device and includes an image of the accessory on the person. The input device, the output device, and the client computer can be located at a first location, while the server computer is located at a second location. In this image, the accessory can be previewed by the customer before purchasing the accessory. Preferably, the accessories include sunglasses, jewelry, eyeglasses or other personal fashion items, which are purchased over the Internet or at a kiosk in communication with the Internet.
